This volume presents research on major issues in syntactic theory within Role and Reference Grammar. This theory was first presented in detail in Functional Syntax and Universal Grammar [FSUG], and these papers represent both expansions and applications of the theory to a wide range of phenomena. The first section contains an introduction to the theory which is the most thorough statement of it since FSUG, summarizing the features of Role and Reference Grammar established there and developing new theoretical components and analyses of syntactic phenomena not discussed in the earlier work. Throughout the discussion features of RRG are compared and contrasted with comparable features of other syntactic theories. The remainder of the volume is devoted to detailed analyses of specific problems, e.g. control, case marking, in a wide variety of languages, e.g. Mandarin Chinese, Nootka, Mparntwe Arrernte and Turkish. Thus the works presented here

illustrate well the strong cross-linguistic approach to syntactic theory and description in Role and Reference Grammar.

Especially in functional-typological linguistics, semantic roles have been studied thoroughly, because they constitute a good starting point for any study on argument marking due to their semantically defined nature. However, the very concept of semantic roles is far from being without problems, and there is still no consensus on how the roles are best defined. In this volume, the notion will be discussed from novel perspectives with the aim of providing new insights into our understanding of semantic roles. Two of the papers deal with semantic role clusters, one with semantic roles in verbless constructions, one with diachrony of semantic roles and two with individual semantic roles that have not been studied in too much detail in previous studies. The book may not offer answers to all questions the readers may have, but at least it raises interesting further questions relevant to arriving at a better understanding of semantic roles. Originally published in *Studies in Language* Vol. 38:3 (2014).

This book constitutes the refereed proceedings of the Second International Workshop on Security, IWSEC 2007, held in Nara, Japan, October 29-31, 2007. The 30 revised full papers presented were carefully reviewed and selected from 112 submissions. The papers are organized in topical sections on subjects including Software and Multimedia security, Public-key cryptography, Network security, E-commerce and Voting, Operating systems, and Security and Information management.

IAG Scientific Assembly, Rio de Janeiro, Brazil, September, 3-9, 1997

The rise of experimental philosophy is generating pressing methodological questions for philosophers. Can findings from experimental studies hold any significance for philosophy as a discipline? Can philosophical theorizing be improved through consideration of such studies? Do these studies threaten traditional philosophical methodology? *Advances in Experimental Philosophy and Philosophical Methodology* addresses these questions, presenting a variety of views on the potential roles experimental philosophy might play in philosophical debate. Featuring contributors from experimental philosophy, as well as those who have expressed criticism of the experimental philosophy movement, this volume reflects on the nature of philosophy itself: its goals, its methods, and its possible future evolution. Tackling two major themes, contributors discuss the recent controversy over the degree to which intuition plays a major role in philosophical methodology and the characterization of the role of the experimental philosophy project. They also look at the relationship between so-called 'positive' and 'negative' projects and examine possible links between experimental and mainstream philosophical

problems. Close discussion of these themes contributes to the overall goal of the volume: an investigation into the current significance and possible future applications of experimental work in philosophy.

This book constitutes the refereed proceedings of the 7th International Conference on Grid and Pervasive Computing, GPC 2012, held in Hong Kong, China, in May 2012. The 9 revised full papers and 19 short papers were carefully revised and selected from 55 submissions. They are organized in topical sections on cloud computing, grid and service computing, green computing, mobile and pervasive computing, scheduling and performance, and trust and security. Also included are 4 papers presented at the 2012 International Workshop on Mobile Cloud and Ubiquitous Computing (Mobi-Cloud 2012) held in conjunction with GPC 2012.

The authors provide cogent summaries of what is known about early gestural development, interactive processes adapted to visual communication, & the processes of semantic, syntactic, & pragmatic development in sign.

The use of sign language has a long history. Indeed, humans' first languages may have been expressed through sign. Sign languages have been found around the world, even in communities without access to formal education. In addition to serving as a primary means of communication for Deaf communities, sign languages have become one of hearing students' most popular choices for second-language study. Sign languages are now accepted as complex and complete languages that are the linguistic equals of spoken languages. Sign-language research is a relatively young field, having begun fewer than 50 years ago. Since then, interest in the field has blossomed and research has become much more rigorous as demand for empirically verifiable results have increased. In the same way that cross-linguistic research has led to a better understanding of how language affects development, cross-modal research has led to a better understanding of how language is acquired. It has also provided valuable evidence on the cognitive and social development of both deaf and hearing children, excellent theoretical insights into how the human brain acquires and structures sign and spoken languages, and important information on how to promote the development of deaf children. This volume brings together the leading scholars on the acquisition and development of sign languages to present the latest theory and research on these topics. They address theoretical as well as applied questions and provide cogent summaries of what is known about early gestural development, interactive processes adapted to visual communication, linguistic structures, modality effects, and semantic, syntactic, and pragmatic development in sign. Along with its companion volume, *Advances in the Spoken Language Development of Deaf and Hard-of Hearing Children*, this book will provide a deep and broad picture about what is known about deaf children's language development in a variety of situations and contexts. From this base of information, progress in research and its

application will accelerate, and barriers to deaf children's full participation in the world around them will continue to be overcome.
