AIRPORT DESIGN AND OPERATION

The standard procedures for the design and operation of airport passenger terminal buildings (PTBs) often lead to either high operating and maintenance costs or passenger dissatisfaction. A new philosophy of planning, design, and operation that is based on optimum resource utilization and passenger flow management and control was initiated.

An airport operator should ensure that all operational personnel are trained and competent to operate in those safety-critical areas. There are many activities that are performed on the airside area of an airport and an understanding of these is essential for a safe and efficient conduct of aircraft and vehicle movements.

This book presents a new approach to airport design and operation. The two are always closely related and influence each other; a poor design affects the airport operation and results in increased costs, however it is not possible to design airport infrastructure without a sound knowledge of the airport operation. This is emphasised throughout this whole book. The approach reflects not only the authors' experience from more than 350 airport studies but also their commercial pilot, aeronautical engineering and military air traffic controller background. Several key topics are addressed throughout the book, such as low cost airline operation, security issues, and EASA regulations on airports. In order to attain a reasonable depth, the book concentrates on selected topics of particular relevance to problems of airport development and operation.

First published in 1979, Airport Engineering by Ashford and Wright, has become a classic textbook in the education of airport engineers and transportation planners. Over the past twenty years, construction of new airports in the US has waned as construction abroad boomed. This new edition of Airport Engineering will respond to this shift in the growth of airports globally, with a focus on the role of the International Civil Aviation Organization (ICAO), while still providing the best practices and tested fundamentals that have made the book successful for over 30 years.

This book details how Building Information Modelling is being successfully deployed in the planning, design, construction and future operation of the Istanbul New Airport, a mega-scale construction project incorporating a varying mix of infrastructures including terminals, runways, passenger gates, car parks, railways and roads. The book demonstrates how Airport Building Information Modelling (ABIM) is being used to: | facilitate collaboration, cooperation and integrated project delivery | manage subcontractors and eliminate cost over-runs | reduce waste on site and enhance overall quality | connect people in a virtual environment to encourage collaborative working | provide clients with an effective interface for lifecycle management including: design development, construction documentation, construction phases and BIM and Big Data Integration for future facilities management The book presents a best practice BIM project, demonstrating concurrent engineering, lean processes, collaborative design and construction, and effective construction management. Moreover, the book provides a visionary exemplar for the further use of BIM technologies in civil engineering projects including highways, railways and others on the way towards the Smart City vision. It is essential reading for all Built Environment and Engineering stakeholders.

TRB's Airport Cooperative Research Program (ACRP) Report 25, Airport Passenger Terminal Planning and Design comprises a guidebook, spreadsheet models, and a user's guide in two volumes and a CD-ROM intended to provide guidance in planning and developing airport passenger terminals and to assist users in analyzing common issues related to airport terminal planning and design. Volume 1 of ACRP Report 25 explores the passenger terminal planning process and provides, in a single reference document, the important criteria and requirements needed to help address emerging trends and develop potential solutions for airport passenger terminals. Volume 1 addresses the airside, terminal building, and landside components of the terminal complex. Volume 2 of ACRP Report 25 consists of a CD-ROM containing 11 spreadsheet models, which include practical learning exercises and several airport-specific sample data sets to assist users in determining appropriate model inputs for their situations, and a user's guide to assist the user in the correct use of each model. The models on the CD-ROM include such aspects of terminal planning as design hour determination, gate demand, check-in and passenger and baggage screening, which require complex analyses to support planning decisions. The CD-ROM is also available for download from TRB's website as an ISO image.

"This guidebook will help airports with Emergency Operations Center (EOC) planning and design considerations, such as (1) establishing an EOC in an existing facility; (2) upgrading a current EOC facility; (3) designing and building a new facility within the terminal (or other existing campus building); and (4) designing and building a greenfield project, which means the airport is not bound by any constraints with existing buildings or infrastructure such as the terminal or toher existing campus structures." -- Page 1.
